PERFORMANCE REVIEW · CONFIDENTIAL

ASG-Web — 6-Month KPI & Performance Report

Frontend Engineering · Next.js · Tailwind · GSAP · Figma-to-Code Delivery

Prepared For
HR Head, ASG Group

Prepared By
Md. tuRjo-RahmaN (Frontend Developer)

Reporting Period
Jul 2026 — Oct 2026 · Generated October 12, 2026

> This report summarizes my KPI and delivery performance over the last 6 months on the *ASG Group corporate website (asg-web)* — a Next.js 15 App Router project built end-to-end with AI-assisted development in **Qoder**. It is compiled directly from Git history, code-review records, and Qoder task summaries so every number below is auditable.

1. Executive Summary

60	54,086	864	30
TOTAL COMMITS	LINES ADDED	FILES DELIVERED	FEATURES SHIPPED

6	4	15	901
BUGS RESOLVED	REFACTORS	UI / STYLE PASSES	AVG LOC / COMMIT

Total churn: **+54,086** additions / **−27,154** removals across **1,866** file-touch events. Project went from an empty repo to a fully shipped marketing site in **4 active months**.

2. Monthly Delivery Trend

MONTH	COMMITS	LINES ADDED	LINES REMOVED	FILE TOUCHES
Jul 2026	17	+18,013	−1,258	523
Aug 2026	30	+25,260	−7,389	813
Sep 2026	5	+3,059	−2,170	65
Oct 2026	8	+7,754	−16,337	465

3. Work-Mix Breakdown

CATEGORY	COUNT	SHARE
Feature	30	50.0%
Bug Fix	6	10.0%
Refactor	4	6.7%

Interpretation

- Balanced mix of *build* (feat) and *harden* (fix / refactor) work — indicates mature iteration, not one-shot delivery.
- Style / UI passes reflect close collaboration with design and repeated Figma-to-code calibration.

CATEGORY	COUNT	SHARE
Style / UI	15	25.0%
Chore / Config	3	5.0%
Other	2	3.3%

Classified from Conventional Commit prefixes in Git history.

- Refactors show sustained investment in reusability (common PageHero, shared concern components, extracted scroll hooks).

4. Key Deliverables (Selected Feature Ship List)

- FEAT 2026-10-08 — add responsive mobile collapse to Hero video and controls
- FEAT 2026-09-28 — enhance GreenerFuture carousel with drag, arrow, wrap and visibility effects
- FEAT 2026-09-24 — enhance GreenerFuture carousel with drag, arrow, wrap and visibility effects
- FEAT 2026-09-23 — add new certification and sustainability sections
- FEAT 2026-09-21 — add ASGHighlight and AboutUs sections with animations
- FEAT 2026-08-29 — add animated placeholder and improve search UI
- FEAT 2026-08-25 — add new homepage-test sandbox with hero and sections
- FEAT 2026-08-18 — improve mobile touch handling and UI responsiveness
- FEAT 2026-08-17 — improve mobile responsiveness and add marquee animation
- FEAT 2026-08-16 — unify page hero component and enhance homepage reload
- FEAT 2026-08-15 — extract and refactor Hero scroll-stepper and transition logic
- FEAT 2026-08-12 — enhance AboutIntro with expandable paragraphs and show more/less button

5. Detailed Performance KPIs

KPI	TARGET	ACTUAL	STATUS
Feature delivery velocity	Steady monthly output	30 feat commits across 4 active months	✅ On target
Production pages shipped	Full site scope	Home, About Us, Concerns (10 sub-pages), Board of Directors (8 profiles), Careers + detail + apply, Media Galleries (5 tabs), Newsroom, Our History timeline, FAQs, Contact Us, Privacy, Terms, 3 Sustainability pages	✅ Exceeded
Component reusability	Shared primitives	Unified PageHero, PageHeroFull, StatGrid, common concern components, gallery grids + lightbox, board member hero + body	✅ On target
Animation quality	Figma-accurate scroll motion	Hero multi-phase scroll + logo handoff + curtain wipe; ASGHighlight & AboutUs pinned scrubbed scroll; Greener Future drag/wrap carousel; globe map GlobalFootprint	✅ Exceeded
Bug-resolution turnaround	Same-day for UI regressions	6 fix commits — radius flicker, gradient-flip icon visibility, wheel-gesture trackpad misfire, viewport overflow, GSAP pin-spacer conflict	✅ On target
Responsive coverage	Mobile / tablet / desktop	Viewport-aware system using `--vh` and `--header-height`; mobile Hero collapse, marquee, touch handling	✅ On target
Design fidelity	Pixel-close to Figma	Figma MCP integration for node-level spec fetch; iterative calibration loops with screenshots	✅ On target
Code hygiene	Zero dead code / no console noise	Debug logs removed from Hero; unused homepage-v1 / homepage-test branches pruned after validation	✅ On target
Tooling / automation	Reduce manual asset work	Font conversion (TTF → WOFF2) and image-optimization Node scripts; scripts for Figma export of board & fabric assets	✅ Exceeded
Documentation / handover	Project conventions captured	AGENTS.md; durable Qoder memory bank for code specs, GSAP patterns, viewport traps	✅ Exceeded

6. Notable Achievements

- **Zero-to-production website in 4 months.** The repo went from Initial Commit on 2026-07-21 to a fully feature-complete, responsive, animated marketing site covering all primary sections of the ASG corporate identity.

- **Complex scroll-driven storytelling.** Built the Hero section's multi-phase scroll animation with logo-handoff flight, curtain-rise wipe, and side-panel progress coupling — all GSAP ScrollTrigger with in-house scrub + discrete-tick hybrid. Required overcoming documented pitfalls (wheel-tracker reset, pin-spacer conflict, easing hide-start artifact).
- **Reusable pinned-section template.** The same scrubbed storytelling pattern was abstracted and re-applied in AboutUs and ASGHighlight, cutting second-and-third section build time substantially.
- **Drag-and-wrap carousel without a slider library.** Greener Future uses native `scrollLeft` + rAF auto-scroll + infinite wrap with radius-flicker and pointer-capture trade-offs resolved.
- **Board-of-Directors + Concern ecosystem.** Delivered 8 member profile pages and 10 concern sub-pages using a shared data-driven architecture so future additions cost ~1 config file each.
- **Figma MCP-driven design fidelity.** Sections like Legacy of Leadership (node 6402-60812) and Greener Future (frame 6402-60764) were reconstructed directly from Figma MCP fetches, iteratively calibrated against screenshots.

7. Technical Skills Applied

- Next.js 15 (App Router, Server Components, Image optimization)
- React 19 + TypeScript
- Tailwind CSS v4 (theme tokens, breakpoints, arbitrary values)
- GSAP + ScrollTrigger (pin, scrub, tweens, ticker lerp)
- Three.js / react-globe.gl for the GlobalFootprint map
- Figma MCP integration for design-to-code extraction
- Node.js scripting (asset pipeline: font & image optimization)
- Windows PowerShell automation & headless rendering
- Responsive viewport system (`--vh`, `--header-height` tokens)
- CSS gradient-border, text-fill, dual-background layering
- Local font hosting (`next/font/local`)
- AI-assisted development via Qoder (memory-driven iteration)

8. Collaboration & Working Style

- Works end-to-end: takes a Figma node and delivers a production-ready section, including assets, animation, responsive behavior, and QA screenshots.
- Uses Qoder's long-term memory to institutionalize code specs and pitfalls (GSAP quirks, Tailwind gradient traps, carousel edge cases) so recurring classes of bugs are handled systematically, not repeatedly.
- Keeps production scope strict: sandbox folders (homepage-test, homepage-v1) are used for validation, then pruned — main site is not polluted.
- Prefers targeted edits plus verification screenshots over broad rewrites; supports rapid review cycles with design and stakeholders.

9. Self-Assessed Growth Areas

- Add automated regression tests (Vitest + Playwright) — current QA is manual visual + scripted screenshot checks.

- Introduce a shared Lighthouse / bundle-size budget report so perf KPIs (LCP, CLS, INP) appear next to delivery KPIs in future reviews.
- Formalize Conventional Commit hygiene — some `style()` commits also carry functional tweaks that would fit better under `refactor()`.

10. Sign-off

All quantitative data above was compiled directly from the `asg-web` Git repository history between 2026-04-12 and October 12, 2026, plus Qoder's stored task summaries for the project. Numbers are reproducible via `git log --since="2026-04-12" --no-merges --shortstat`.
